

CLAIMS

We claim:

1        1. A device for connecting an electric motor, comprising:  
2                  two electrical conductors leading to the electric motor; and  
3                  a suppressor arranged between said two electrical conductors, wherein said  
4                  suppressor includes a capacitor and a varistor connected in parallel.

1        2. The device of claim 1, wherein said varistor is a disk type varistor.  
1        3. The device of claim 1, further comprising a casing made of fuel resistant  
2                  plastic.  
1        4. The device of claim 3, wherein said casing is integrally connected with said  
2                  suppressor.

1        5. The device of claim 3, further comprising inductors respectively connected to  
2                  said two electrical conductors, wherein said casing is integrally connected with said suppressor  
3                  and with said inductors.

1        6. A combination including an electric motor and a device for connecting the  
2                  electric motor, said device comprising:  
3                  two electrical conductors leading to the electric motor;  
4                  a suppressor arranged between said two electrical conductors, wherein said  
5                  suppressor includes a capacitor and a varistor connected in parallel;  
6                  a casing made of fuel resistant plastic; and

7               inductors respectively connected to said two electrical conductors, wherein said  
8   casing is integrally connected with said suppressor, said inductors and regions of said electric  
9   motor which adjoin said inductors.
